

Integrating the driver experience

VIRTIO AGL integration
18.08.2020

Architecture of AGL with Virtualization: I

- AGL guests:
 - **vanilla kernel**
 - **AGL BSP**
 - no pass-through device access
 - can run in qemu on x86/arm host
- Virtualization platform:
 - Provides virtio interfaces to **AGL guests**
 - can be **AGL or non-AGL**
 - pass-through devices access

- AGL guests:
 - **Vendor BSP kernel**
 - **Vendor + AGL BSP**
 - pass-through device access
 - Leverage SoC **virtualization support**
- Virtualization platform:
 - Provides virtio interface to **AGL guests**
 - can be **AGL or non-AGL**
 - pass-through devices access

AGL **without** phys HW access:

Pros:

- HW/BSP/Hypervisor independent, one AGL image for everyone
- Latest Linux kernel can be used, independently from 'host' BSP-specific kernels
- Can be developed in emulator (e.g. Qemu/KVM)
- Clear "host" VM / "guest" VMs separation (no circular dependencies)

Cons:

- Limited HW virtualization leverage
- Larger virtio interfaces gap needs to be filled (new virtio devices needed)

AGL **with** phys HW access:

Pros:

- Exclusive pass-through access to HW (e.g. connectivity HW: wifi/bt)
- HW virtualization support leverage
- Re-use existing HW-specific SW

Cons:

- HW/BSP specifics (kernel ver, drivers etc.) for each supported board
